# Activity: Develop an algorithm

# **Activity: Develop an algorithm**

## Introduction

An algorithm is a set of steps that can be used to solve a problem. Security analysts develop algorithms to provide the solutions that they need for their work. For example, an analyst may work with users who bring them devices. The analyst may need an algorithm that first checks if a user is approved to access the system and then checks if the device that they have brought is the one assigned to them.

In this lab, you'll develop an algorithm in Python that automates this process.

# Tips for completing this lab

- •
- •
- •
- •

## **Scenario**

In this lab, you're working as a security analyst and you're responsible for developing an algorithm that connects users to their assigned devices. You'll write code that indicates if a user is approved on the system and has brought their assigned device to the security team.

## Task 1

You'll work with a list of approved usernames along with a list of the approved devices assigned to these users. The elements of the two lists are synchronized. In other words, the user at index 0 in approved\_users uses the device at index 0 in approved\_devices. Later, this will allow you to verify if the username and device ID entered by a user correspond to each other.

First, to explore how indices in lists work, run the following code cell as is and observe the output. Then, replace each 0 with another index and run the cell to observe what happens.

```
In [2]:
# Assign `approved_users` to a list of approved usernames
approved_users = ["elarson", "bmoreno", "tshah", "sgilmore", "eraab"]
# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`
```

```
approved_devices = ["8rp2k75", "hl0s5o1", "2ye3lzg", "4n482ts", "a307vir"]

# Display the element at the specified index in `approved_users`

print(approved_users[1])

# Display the element at the specified index in `approved_devices`

print(approved_devices[1])
```

bmoreno hl0s5o1

#### **Question 1**

What did you observe about the output when approved\_users[0] is displayed and when approved\_devices[0] is displayed? What happens when you replace each 0 with another index?

It prints the first element from both lists. After changing, the indexes it prints corresponding elements from both lists

## Task 2

There's a new employee joining the organization, and they need to be provided with a username and device ID. In the following code cell, you are given a username and device ID of this new user, stored in the variables new\_user and new\_device, respectively. Use the .append() method to add these variables to the approved\_users and approved\_devices respectively. Afterwards, display the approved\_users and approved\_devices variables to confirm the added information. Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "tshah", "sgilmore", "eraab"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5ol", "2ye3lzg", "4n482ts", "a307vir"]

# Assign `new_user` to the username of a new approved user

new_user = "gesparza"
```

```
# Assign `new_device` to the device ID of the new approved user

new_device = "3rcv4w6"

# Add that user's username and device ID to `approved_users` and 
`approved_devices` respectively

approved_users.append(new_user)
approved_devices.append(new_device)

# Display the contents of `approved_users`

print(approved_users)

# Diplay the contents of `approved_devices`

print(approved_devices)

['elarson', 'bmoreno', 'tshah', 'sgilmore', 'eraab', 'gesparza']
['8rp2k75', 'hl0s5o1', '2ye3lzg', '4n482ts', 'a307vir', '3rcv4w6']
```

Hint 2

#### Question 2

After the new approved user is added, what did you observe about the output when approved\_users is displayed and when approved\_devices is displayed?

Both new\_user and new\_device got appended to the end of the approved\_users and approved\_devices list.

## Task 3

An employee has left the team and should no longer have access to the system. In the following code cell, you are given the username and device ID of the user to be removed, stored in the variables removed\_user and removed\_device respectively. Use the .remove() method to remove each of these elements from the corresponding list. Afterwards, display both the approved\_users and the approved\_devices variables to view the removed users. Run the code and observe the results. Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

```
In [4]:
```

```
approved users = ["elarson", "bmoreno", "tshah", "sgilmore", "eraab",
"gesparza"]
# Assign `approved devices` to a list of device IDs that correspond to the
usernames in `approved users`
approved devices = ["8rp2k75", "hl0s5o1", "2ye3lzg", "4n482ts", "a307vir",
"3rcv4w6"]
# Assign `removed user` to the username of the employee who has left the team
removed user = "tshah"
# Assign `removed device` to the device ID of the employee who has left the
team
removed device = "2ye3lzg"
# Remove that employee's username and device ID from `approved users` and
`approved devices` respectively
approved users.remove("tshah")
approved devices.remove("2ye3lzg")
# Display `approved users`
print(approved users)
# Diplay `approved devices`
print(approved devices)
['elarson', 'bmoreno', 'sgilmore', 'eraab', 'gesparza']
['8rp2k75', 'hl0s5o1', '4n482ts', 'a307vir', '3rcv4w6']
```

Hint 2

### **Question 3**

After the user who left the team is removed, what did you observe about the output when approved\_users is displayed and when approved\_devices is displayed?

Both removed user and removed device were no longer in the lists after using the .remove() method.

## Task 4

As part of verifying a user's identity in the system, you'll need to check if the user is one of the approved users. Write a conditional statement that verifies if a given username is an element of the list of approved usernames. If it is, display "The user \_\_\_\_ is approved to access the system." Otherwise, display "The user \_\_\_\_ is not approved to access the system." Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

```
In [5]:
# Assign `approved users` to a list of approved usernames
approved users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]
# Assign `approved devices` to a list of device IDs that correspond to the
usernames in `approved users`
approved devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]
# Assign `username` to a username
username = "sgilmore"
# Conditional statement
# If `username` belongs to `approved users`, then display "The user is
approved to access the system."
# Otherwise display "The user is not approved to access the system."
if username in approved users:
  print ("The username", username, "is approved to access the system.")
else:
  print("The username", username, "is not approved to access the system.")
```

The username sgilmore is approved to access the system.

Hint 1

Hint 2

Hint 3

**Question 4** 

What message do you observe in the output when username is "sgilmore"? The username sgilmore is approved to access the system.

# Task 5

The next part of the algorithm uses the .index() method to find the index of username in the approved\_users and store that index in a variable named ind.

When used on a list, the .index() method will return the position of the given value in the list.

Add a statement to display ind in the following code cell to explore the value it contains. Be sure to replace the ### YOUR CODE HERE ### with your own code before you run the following cell.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]

# Assign `username` to a username

username = "sgilmore"

# Assign `ind` to the index of `username` in `approved_users`

ind = approved_users.index(username)

# Display the value of `ind`

print(ind)

2
```

#### Hint 1

#### **Question 5**

What do you observe from the output when username is "sgilmore"?

## Task 6

This task will allow you to build your understanding of list operations for the algorithm that you'll eventually build. It will demonstrate how you can find an index in one list and then use this index to display connected information in another list. First, use the .index() method again to find the index of username in the approved\_users and store that in a variable named ind. Then, connect ind

to the approved\_devices and display the device ID located at the index ind. Afterwards, run the cell to observe the result. Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5ol", "4n482ts", "a307vir", "3rcv4w6"]

# Assign `username` to a username

username = "sgilmore"

# Assign `ind` to the index of `username` in `approved_users`

ind = approved_users.index(username)

# Display the device ID at the index that matches the value of `ind` in `approved_devices`

print(approved_devices[ind])
```

Hint 1

4n482ts

Hint 2

**Question 6** 

What do you observe from the output when username is "sgilmore"? 4n482ts

# Task 7

Your next step in creating the algorithm is to determine if a username and device ID correspond. To do this, write a conditional that checks if the username is an element of the approved\_devices and if the device\_id stored at the same index as username matches the device\_id entered. You'll use the logical operator and to connect the two conditions. When both conditions evaluate to True, display a message that the username is approved and another message that the user has

their assigned device. Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

In [13]:

# Assign `approved\_users` to a list of approved usernames
approved\_users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]
# Assign `approved\_devices` to a list of device IDs that correspond to the usernames in `approved\_users`
approved\_devices = ["8rp2k75", "hl0s5ol", "4n482ts", "a307vir", "3rcv4w6"]
# Assign `username` to a username
username = "sgilmore"
# Assign `device\_id` to a device ID
device\_id = "4n482ts"
# Assign `ind` to the index of `username` in `approved\_users`

# If `username` belongs to `approved\_users`, and if the device ID at `ind` in

ind = approved users.index(username)

# Conditional statement

`approved\_devices` matches `device\_id`,
# then display a message that the username is approved,

# then display a message that the username is approved,
# followed by a message that the user has the correct device

if username in approved\_users and device\_id == approved\_devices[ind]:
 print("The username", username, "is approved to access the system.")
 print(device id, "is the assigned device for", username)

The username sgilmore is approved to access the system.

4n482ts is the assigned device for sgilmore

#### Hint 1

#### Hint 2

#### **Question 7**

What do you observe from the output when username is "sgilmore" and device\_id is "4n482ts"?

The username sgilmore is approved to access the system. 4n482ts is the assigned device for sgilmore

## Task 8

It would also be helpful for users to receive messages when their username is not approved or their device ID is incorrect.

Add to the code by writing an elif statement. This elif statement should run when the username is part of the approved\_users but the device\_id doesn't match the corresponding device ID in the approved\_devices. The statement should also display two messages conveying that information.

Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

(After you run the code once with a device\_id of "4n482ts", you might want to explore what happens if you assign a different value to device\_id.)

```
In [19]:
# Assign `approved users` to a list of approved usernames
approved users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]
# Assign `approved devices` to a list of device IDs that correspond to the
usernames in `approved users`
approved devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]
# Assign `username` to a username
username = "sqilmore"
# Assign `device id` to a device ID
device id = "4n482ts"
# Assign `ind` to the index of `username` in `approved users`
ind = approved users.index(username)
# If statement
# If `username` belongs to `approved users`, and if the element at `ind` in
`approved_devices` matches `device_id`,
# then display a message that the username is approved,
# followed by a message that the user has the correct device
```

```
if username in approved_users and device_id == approved_devices[ind]:
    print("The user", username, "is approved to access the system.")
    print(device_id, "is the assigned device for", username)

# Elif statement
# Handles the case when `username` belongs to `approved_users` but element at `ind` in `approved_devices` does not match `device_id`,
# and displays two messages accordingly

elif username in approved_users and device_id != approved_devices[ind]:
    print("The user", username, "is approved to access the system, but",
device_id, "is not their assigned device.")
```

The user sgilmore is approved to access the system. 4n482ts is the assigned device for sgilmore

Hint 1

Hint 2

**Question 8** 

What do you observe from the output when username is "sgilmore" and device\_id is "4n482ts"?

The user sgilmore is approved to access the system. 4n482ts is the assigned device for sgilmore

## Task 9

In this task, you'll complete your algorithm by developing a function that uses some of the code you've written in earlier tasks. This will automate the login process.

There are multiple ways to use conditionals to automate the login process. In the following code, a nested conditional is used to achieve the goals of the algorithm. There is a conditional statement inside of another conditional statement. The outer conditional handles the case when the username is approved and the case when username is not approved. The inner conditional, which is placed inside the first if statement, handles the case when the username is approved and the device\_id is correct, as well as the case when the username is approved and the device\_id is incorrect.

To complete this task, you must define a function named login that takes in two parameters, username and device\_id. Afterwards, call the function and pass in different username and device ID combinations to experiment and observe the function's behavior. Be sure to replace the ###

YOUR CODE HERE ### with your own code before you run the following cell.

```
# Assign `approved users` to a list of approved usernames
approved users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]
# Assign `approved devices` to a list of device IDs that correspond to the
usernames in `approved users`
approved_devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]
# Define a function named `login` that takes in two parameters, `username`
and `device id`
def login(username, device id):
   # If `username` belongs to `approved_users`,
  if username in approved users:
       # then display "The user is approved to access the system.",
      print("The user", username, "is approved to access the system.")
       # assign `ind` to the index of `username` in `approved_users`,
      ind = approved users.index(username)
       # and execute the following conditional
       # If `device id` matches the element at the index `ind` in
`approved devices`,
      if device id == approved devices[ind]:
        # then display " is the assigned device for "
        print(device id, "is the assigned device for", username)
       # Otherwise,
      else:
        # display " is not their assigned device"
        print(device id, "is not their assigned device.")
```

```
# Otherwise (part of the outer conditional and handles the case when
`username` does not belong to `approved_users`),

else:

# Display "The user _____ is not approved to access the system."

print("The username", username, "is not approved to access the system.")

# Call the function you just defined to experiment with different username and device_id combinations

login("bmoreno", "h10s5o1")
login("elarson", "4n482ts")
login("Nav", "3rcv4w6")
```

The user bmoreno is approved to access the system.

hl0s5o1 is the assigned device for bmoreno

The user elarson is approved to access the system.

4n482ts is not their assigned device.

The username Nav is not approved to access the system.

Hint 1

Hint 2

Hint 3

#### **Question 9**

After Python enters the inner conditional, what happens when the device\_id is correct, and what happens when the device\_id is incorrect?

When the device\_id is correct it displays dveice\_id is assigned to the username. And when the device\_id is incorrect it prnits device\_id, "is not their assigned device."

# Conclusion

### What are your key takeaways from this lab?

```
Algorithm can be very helpful in solving a problem by taking input from it.

Breaking algorithm in smaller parts help solving the problem.

.append method to attach data to the existing list

.remove help removing an element from the list
```

# **Exemplar: Develop an algorithm**

## Introduction

An algorithm is a set of steps that can be used to solve a problem. Security analysts develop algorithms to provide the solutions that they need for their work. For example, an analyst may work with users who bring them devices. The analyst may need an algorithm that first checks if a user is approved to access the system and then checks if the device that they have brought is the one assigned to them.

In this lab, you'll develop an algorithm in Python that automates this process.

# Tips for completing this lab

- •
- •
- •
- \_

## Scenario

In this lab, you're working as a security analyst and you're responsible for developing an algorithm that connects users to their assigned devices. You'll write code that indicates if a user is approved on the system and has brought their assigned device to the security team.

## Task 1

You'll work with a list of approved usernames along with a list of the approved devices assigned to these users. The elements of the two lists are synchronized. In other words, the user at index 0 in approved\_users uses the device at index 0 in approved\_devices. Later, this will allow you to verify if the username and device ID entered by a user correspond to each other.

First, to explore how indices in lists work, run the following code cell as is and observe the output. Then, replace each 0 with another index and run the cell to observe what happens.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "tshah", "sgilmore", "eraab"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5o1", "2ye3lzg", "4n482ts", "a307vir"]

# Display the element at the specified index in `approved_users`
```

```
print(approved_users[0])

# Display the element at the specified index in `approved_devices`

print(approved_devices[0])

elarson
8rp2k75
```

#### **Question 1**

What did you observe about the output when approved\_users[0] is displayed and when approved\_devices[0] is displayed? What happens when you replace each 0 with another index?

When approved\_users[0] is displayed, the output is the first approved username from approved\_users. When approved\_devices[0] is displayed, the output is the first device ID from approved\_devices. When you replace each 0 with another index, the output is the element at that index in approved\_users, followed by the element at that index in approved\_devices. For example, if you replace each 0 with 2, the output is the element at index 2 in approved\_users, followed by the element at index 2 in approved\_devices.

## Task 2

There's a new employee joining the organization, and they need to be provided with a username and device ID. In the following code cell, you are given a username and device ID of this new user, stored in the variables new\_user and new\_device, respectively. Use the .append() method to add these variables to the approved\_users and approved\_devices respectively. Afterwards, display the approved\_users and approved\_devices variables to confirm the added information. Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "tshah", "sgilmore", "eraab"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5o1", "2ye3lzg", "4n482ts", "a307vir"]

# Assign `new_user` to the username of a new approved user
```

```
new_user = "gesparza"

# Assign `new_device` to the device ID of the new approved user

new_device = "3rcv4w6"

# Add that user's username and device ID to `approved_users` and `approved_devices` respectively

approved_users.append(new_user)
approved_devices.append(new_device)

# Display the contents of `approved_users`

print(approved_users)

# Diplay the contents of `approved_devices`

print(approved_devices)

['elarson', 'bmoreno', 'tshah', 'sgilmore', 'eraab', 'gesparza']
['8rp2k75', 'hl0s5o1', '2ye3lzg', '4n482ts', 'a307vir', '3rcv4w6']
```

Hint 2

**Question 2** 

After the new approved user is added, what did you observe about the output when approved\_users is displayed and when approved\_devices is displayed?

After the new approved user is added, their username is at the end of the approved\_users and their device ID is at the end of the approved\_devices.

## Task 3

An employee has left the team and should no longer have access to the system. In the following code cell, you are given the username and device ID of the user to be removed, stored in the variables removed\_user and removed\_device respectively. Use the .remove() method to remove each of these elements from the corresponding list. Afterwards, display both the approved\_users and the approved\_devices variables to view the removed users. Run the code and observe the results. Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

In [3]:

```
approved users = ["elarson", "bmoreno", "tshah", "sgilmore", "eraab",
"qesparza"]
# Assign `approved devices` to a list of device IDs that correspond to the
usernames in `approved users`
approved devices = ["8rp2k75", "hl0s5o1", "2ye3lzg", "4n482ts", "a307vir",
"3rcv4w6"]
# Assign `removed user` to the username of the employee who has left the team
removed user = "tshah"
# Assign `removed_device` to the device ID of the employee who has left the
team
removed device = "2ye3lzg"
# Remove that employee's username and device ID from `approved users` and
`approved devices` respectively
approved users.remove(removed user)
approved devices.remove(removed device)
# Display `approved users`
print(approved users)
# Diplay `approved devices`
print(approved devices)
['elarson', 'bmoreno', 'sgilmore', 'eraab', 'gesparza']
['8rp2k75', 'hl0s5o1', '4n482ts', 'a307vir', '3rcv4w6']
```

Hint 2

### **Question 3**

After the user who left the team is removed, what did you observe about the output when approved\_users is displayed and when approved\_devices is displayed?

After the user who left the team is removed, their username is no longer part of the approved\_users and their device ID is no longer part of the approved\_devices.

## Task 4

As part of verifying a user's identity in the system, you'll need to check if the user is one of the approved users. Write a conditional statement that verifies if a given username is an element of the list of approved usernames. If it is, display "The user \_\_\_\_ is approved to access the system." Otherwise, display "The user \_\_\_\_ is not approved to access the system." Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

```
In [4]:
# Assign `approved users` to a list of approved usernames
approved users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]
# Assign `approved devices` to a list of device IDs that correspond to the
usernames in `approved users`
approved devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]
# Assign `username` to a username
username = "sgilmore"
# Conditional statement
# If `username` belongs to `approved users`, then display "The user is
approved to access the system."
# Otherwise display "The user is not approved to access the system."
if username in approved users:
  print("The username", username, "is approved to access the system.")
else:
  print("The username", username, "is not approved to access the system.")
```

The username sgilmore is approved to access the system.

Hint 1

Hint 2

Hint 3

**Question 4** 

What message do you observe in the output when username is "sgilmore"?

When username is "sgilmore", the outputted message reads "The username sgilmore is approved to access the system." since "sgilmore" is an element of the approved\_users.

## Task 5

The next part of the algorithm uses the .index() method to find the index of username in the approved\_list and store that index in a variable named ind.

When used on a list, the .index() method will return the position of the given value in the list.

Add a statement to display ind in the following code cell to explore the value it contains. Be sure to replace the ### YOUR CODE HERE ### with your own code before you run the following cell.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]

# Assign `username` to a username

username = "sgilmore"

# Assign `ind` to the index of `username` in `approved_users`

ind = approved_users.index(username)

# Display the value of `ind`

print(ind)

2
```

#### Hint 1

#### Question 5

What do you observe from the output when username is "sqilmore"?

When username is "sgilmore", the output is 2, which indicates that the index value of "sgilmore" is 2 in the approved\_users. In other words, "sgilmore" is the third element in the approved\_users. Indexing in Python starts at 0.

## Task 6

This task will allow you to build your understanding of list operations for the algorithm that you'll eventually build. It will demonstrate how you can find an index in one list and then use this index to display connected information in another list. First, use the <code>.index()</code> method again to find the index of <code>username</code> in the <code>approved\_users</code> and store that in a variable named <code>ind</code>. Then, connect <code>ind</code> to the <code>approved\_devices</code> and display the device ID located at the index <code>ind</code>. Afterwards, run the cell to observe the result. Be sure to replace each <code>### YOUR CODE HERE ###</code> with your own code before you run the following cell.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5ol", "4n482ts", "a307vir", "3rcv4w6"]

# Assign `username` to a username

username = "sgilmore"

# Assign `ind` to the index of `username` in `approved_users`

ind = approved_users.index(username)

# Display the device ID at the index that matches the value of `ind` in `approved_devices`

print(approved_devices[ind])
```

Hint 1

4n482ts

Hint 2

**Question 6** 

What do you observe from the output when username is "sgilmore"?

When username is "sgilmore", the output is 4n482ts, which is the device ID that corresponds to "sgilmore". The third approved username in the approved\_users is "sgilmore", and similarly the third device ID in the approved\_devices is "4n482ts".

## Task 7

Your next step in creating the algorithm is to determine if a username and device ID correspond. To do this, write a conditional that checks if the username is an element of the approved\_devices and if the device\_id stored at the same index as username matches the device\_id entered. You'll use the logical operator and to connect the two conditions. When both conditions evaluate to True, display a message that the username is approved and another message that the user has their assigned device. Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

```
In [7]:
# Assign `approved users` to a list of approved usernames
approved users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]
# Assign `approved devices` to a list of device IDs that correspond to the
usernames in `approved users`
approved devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]
# Assign `username` to a username
username = "sgilmore"
# Assign `device id` to a device ID
device id = "4n482ts"
# Assign `ind` to the index of `username` in `approved_users`
ind = approved users.index(username)
# Conditional statement
# If `username` belongs to `approved users`, and if the device ID at `ind` in
`approved devices` matches `device id`,
# then display a message that the username is approved,
# followed by a message that the user has the correct device
if username in approved users and device id == approved devices[ind]:
   print("The username", username, "is approved to access the system.")
  print(device_id, "is the assigned device for", username)
```

The username sgilmore is approved to access the system. 4n482ts is the assigned device for sgilmore

#### Hint 1

#### Hint 2

#### **Question 7**

What do you observe from the output when username is "sgilmore" and device\_id is "4n482ts"?

When username is "sgilmore" and device\_id is "4n482ts", the output consists of The username sgilmore is approved to access the system. on the first line and 4n482ts is the assigned device for sgilmore on the second line.

## Task 8

It would also be helpful for users to receive messages when their username is not approved or their device ID is incorrect.

Add to the code by writing an elif statement. This elif statement should run when the username is part of the approved\_users but the device\_id doesn't match the corresponding device ID in the approved\_devices. The statement should also display two messages conveying that information.

Be sure to replace each ### YOUR CODE HERE ### with your own code before you run the following cell.

(After you run the code once with a device\_id of "4n482ts", you might want to explore what happens if you assign a different value to device\_id.)

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "hl0s5o1", "4n482ts", "a307vir", "3rcv4w6"]

# Assign `username` to a username

username = "sgilmore"
```

```
# Assign `device id` to a device ID
device id = "4n482ts"
# Assign `ind` to the index of `username` in `approved users`
ind = approved users.index(username)
# If statement
# If `username` belongs to `approved users`, and if the element at `ind` in
`approved devices` matches `device id`,
# then display a message that the username is approved,
# followed by a message that the user has the correct device
if username in approved users and device id == approved devices[ind]:
   print("The user", username, "is approved to access the system.")
  print(device id, "is the assigned device for", username)
# Elif statement
# Handles the case when `username` belongs to `approved users` but element at
`ind` in `approved devices` does not match `device id`,
# and displays two messages accordingly
elif username in approved users and device id != approved devices[ind]:
   print ("The user", username, "is approved to access the system, but",
device id, "is not their assigned device.")
```

The user sgilmore is approved to access the system. 4n482ts is the assigned device for sgilmore

#### Hint 1

#### Hint 2

#### **Question 8**

# What do you observe from the output when username is "sgilmore" and device\_id is "4n482ts"?

When username is "sgilmore" and device\_id is "4n482ts", the output consists of The user sgilmore is approved to access the system. on the first line and 4n482ts is the assigned device for sgilmore on the second line.

If username wasn't in the approved\_devices list, the output would be a message that the user is not approved to access the system.

If username was in the approved\_devices list but device\_id didn't correspond with username, the output would be a message that the user is approved to access the system but the device ID is not assigned to them.

## Task 9

In this task, you'll complete your algorithm by developing a function that uses some of the code you've written in earlier tasks. This will automate the login process.

There are multiple ways to use conditionals to automate the login process. In the following code, a nested conditional is used to achieve the goals of the algorithm. There is a conditional statement inside of another conditional statement. The outer conditional handles the case when the username is approved and the case when username is not approved. The inner conditional, which is placed inside the first if statement, handles the case when the username is approved and the device\_id is correct, as well as the case when the username is approved and the device\_id is incorrect.

To complete this task, you must define a function named login that takes in two parameters, username and device\_id. Afterwards, call the function and pass in different username and device ID combinations to experiment and observe the function's behavior. Be sure to replace the ###

YOUR CODE HERE ### with your own code before you run the following cell.

```
# Assign `approved_users` to a list of approved usernames

approved_users = ["elarson", "bmoreno", "sgilmore", "eraab", "gesparza"]

# Assign `approved_devices` to a list of device IDs that correspond to the usernames in `approved_users`

approved_devices = ["8rp2k75", "h10s5o1", "4n482ts", "a307vir", "3rcv4w6"]

# Define a function named `login` that takes in two parameters, `username` and `device_id`

def login(username, device_id):

# If `username` belongs to `approved_users`,

if username in approved_users:

# then display "The user _____ is approved to access the system.",

print("The user", username, "is approved to access the system.")

# assign `ind` to the index of `username` in `approved_users`,
```

```
ind = approved users.index(username)
       # and execute the following conditional
       # If `device id` matches the element at the index `ind` in
`approved devices`,
      if device id == approved devices[ind]:
        # then display " is the assigned device for "
        print(device id, "is the assigned device for", username)
       # Otherwise,
      else:
        # display " is not their assigned device"
        print(device id, "is not their assigned device.")
    # Otherwise (part of the outer conditional and handles the case when
`username` does not belong to `approved users`),
  else:
       # Display "The user __ is not approved to access the system."
      print ("The username", username, "is not approved to access the
system.")
# Call the function you just defined to experiment with different username
and device id combinations
login("bmoreno", "hl0s5o1")
login("elarson", "r2s5r9g")
login("abernard", "4n482ts")
```

The user bmoreno is approved to access the system.

hl0s5o1 is the assigned device for bmoreno

The user elarson is approved to access the system.

r2s5r9g is not their assigned device.

The username abernard is not approved to access the system.

#### Hint 3

#### Question 9

After Python enters the inner conditional, what happens when the device\_id is correct, and what happens when the device\_id is incorrect?

The following happens after Python enters the inner conditional:

When the device\_id is correct, the inner if condition evaluates to True, and a message that the device ID is assigned to the user is displayed.

When the device\_id is incorrect, the inner if condition evaluates to False, Python enters the else case, and a message that the device ID is not the user's designed device is displayed.

## Conclusion

#### What are your key takeaways from this lab?

- Indexing a list is similar to indexing a string. Index values start at ∅.
- The .append() method helps you add new elements to the end of lists.
- The .remove() method helps you remove elements from lists.
- The .index() method can be used on different types of sequences. They can be used not only with strings, but also with lists.
  - With a list, the .index() method allows you to identify the position where a specified element is located in that list.
- If two lists contain information that correspond to each other in a specific order, you can use indices to pair elements from the lists together.
- Functions can be used to develop algorithms. When defining a function, you must specify the parameters it takes in and the actions it should execute.
